

PMO Copilot — Business Case

Time saved in project reporting · illustrative model

The problem

Project managers spend a large share of each week turning meeting notes into the same artifacts — action trackers, risk and decision logs, and a status report for leadership. The work is manual, repetitive, and easy to let slip: actions get dropped between meetings, status is inconsistent across workstreams, and senior people are pulled off delivery to maintain spreadsheets.

The solution

PMO Copilot converts raw notes (typed or a photo of handwritten ones) into structured, validated PMO artifacts, tracks each item across meetings as one record with a history, and produces the dashboard, Excel tracker, and Word status report from a single source of truth. A person reviews and approves every draft before it commits — the tool removes the typing, not the judgement.

Time-saved model (per project manager)

Activity	Frequency	Manual (each)	With Copilot (each)	Saved / week
Meeting notes → artifacts	5 / week	35 min	10 min (review)	125 min
Weekly status report	1 / week	60 min	15 min	45 min
Total per PM				~170 min (2.8 hrs)

Rolled up:

- ~2.8 hours/week per PM — about **128 hours/year** (45 working weeks).
- Across a 5-PM office: ~640 hours/year — roughly **0.35 FTE** redeployed from reporting to delivery.
- At a loaded rate of €60/hour (assumption): ≈ **€38,000/year** for that office.

Benefits beyond time

- Consistency — every meeting produces the same structured, controlled-vocabulary output, so status is comparable across workstreams.
- Audit trail — items carry a dated history and a compliance flag for anything touching regulation, data protection, or audit; valuable in insurance/finance.
- Faster leadership visibility — a grounded summary or a circulated report is available on demand, not after a manual write-up.
- Fewer dropped actions — cross-meeting tracking means an open item stays visible until it is closed.

Assumptions & scope

- Illustrative model based on the stated assumptions; actual savings scale with meeting cadence and team size.
- Human review is retained by design — the saving is in drafting, not in removing oversight.
- Figures exclude one-off setup and the cost of LLM API calls, which are negligible at this volume (free tier used in the prototype).
